338

CONTENTS

VOLUME V - 1940

LIGHT SOURCES

	page
The new luminous standard	1
Tungsten ribbon lamps for optical measurements	82
Technical photometry of gas-discharge lamps	166
Subjective photometry	280
Rear lights and reflectors for bicycles	335
The blended-light lamp and other mercury lamps with improved colour rendering	341

RADIATION AND ILLUMINATION

The new luminous standard	1
Reflecting surfaces in the neighbourhood of linear sources of light	16
Interesting lighting effect of the Liége water-exhibition	42
Tungsten ribbon lamps for optical measurements	82
Black-out by the filter method	93
The distribution of the light reflected by different ceiling and wall materials	125
Technical photometry of gas-discharge lamps	166
A new fitting for roadlighting	222
Subjective photometry	270
Natural illumination and visibility at night	296
The blended-light lamp and other mercury lamps with improved colour rendering	341

RADIO

The electrometer triode and its applications	54
Testing amplifier output valves by means of the cathode ray tube	61
The hum due to the magnetic field of the filaments in transmitting valves	100
The reproduction of high and low tones in radio receiving sets	115
Electron trajectories in multigrid valves	131
The accuracy of measurements of field strength	149
A new push-pull amplifier valve for decimetre waves	172
Output and distortion of output amplifier valves under differents loads	189
Measurements of phase angles with the help of the cathode ray tube	208
Wireless telephony with moving motor cars	315
A variable amplifier valve with double cathode connection suitable for metre waves	357

SOUND AND ITS AMPLIFICATION

The laryngophone	6
Perspectives in the development of the violin	36
The transport of sound film in apparatus for recording and reproducing	74
Stereophonic sound reproduction	107
The reproduction of high and low tones in radio receiving sets	115
Microphones	140
Experiments with stereophonic records	182
Output and distortion of output amplifier valves under different loads	189
Standardization of acoustic quantities	243
A photocell with amplification by means of secondary emission	253
A tone generator	263
The perception of pitch	286
Optical experiments with models of the directional distribution of sound in halls	321

CATHODE RAYS

The investigation of rapidly changing mechanical stresses with the cathode ray oscillograph	25
Testing amplifier output valves by means of the cathode ray tube	61
Measurement of phase angles with the help of the cathode ray tube	208
An electrodynamic pick-up for the investigation of mechanical vibrations	230
A cathode ray tube with post-acceleration	245
A cathode ray tube for use in toolmaking	277
An electrical pressure indicator for internal combustion engines	348

X RAYS

	page
X ray photographs with extremely short exposure times	22
X ray apparatus for the macroscopic examination of materials	69
The use of X rays and cathode rays in chemical and metallographic investigations	157
X ray photography with the camera	258
The localization of objects in the human body	309
An apparatus for the measurement of the photographic density of films	331

ELECTROTECHNICAL APPARATUS AND METHODS

The use of selenium valves in rectifiers	199
Measurement of phase angles with the help of the cathode ray tube	208
An electrodynamic pick-up for the investigation of mechanical vibrations	230
A photocell with amplification by means of secondary emission	253
A tone generator	263
A cathode ray oscillograph for use in tool making	277
The measurement of very small phase displacements	300
Geometrical configurations and duality of electrical networks	324
An electrical pressure indicator for internal combustion engines	348

MATERIALS AND THEIR RESEARCH

Drilling diamond dies	14
The investigation of rapidly changing mechanical stresses with the cathode ray oscillograph	26
The use of modern steels for permanent magnets	29
X ray apparatus for the macroscopic examination of materials	69
Measurements in the Philips rare gas plant	88
The use of X rays and cathode rays in chemical and metallographic investigations	157
A permanent magnet which can left 3500 times its own weight	195
Metals as getters	217
Adsorption phenomena at metal contacts	238

MISCELLANEOUS

Drilling diamond dies	14
Quantitative considerations in colour photography by the additive method	48
Measurements in the Philips rare gas plant	88
The use of X rays and cathode rays in chemical and metallographic investigations	157
A permanent magnet which can lift 3500 times its own weight	195
Technical temperature measurement with thermoelements	214
Adsorption phenomena at metal contacts	238
A photocell with amplification by means of secondary emission	253
The localization of objects in the human body	309
Geometrical configurations and duality of electrical networks	324
An apparatus for the measurement of the photographic density of films	331
An electrical pressure indicator for internal combustion engines	348
